In single-variable calculus we were concerned with functions that map the real numbers  $\mathbb{R}$  to  $\mathbb{R}$ , sometimes called "real functions of one variable", meaning the "input" is a single real number and the "output" is likewise a single real number. In the last chapter we considered functions taking a real number to a vector, which may also be ...

One of the reasons why property theories formulated in the  $\lambda$ -calculus are of a particular philosophical importance is the hyperintensional nature of the calculus (see section 1.2). A property concept may be called 'hyperintensional' if and only if it does not identify necessarily coextensional properties, i.e. properties that are instantiated by exactly the same objects at ...

In previous sections we've converted Cartesian coordinates in Polar, Cylindrical and Spherical coordinates. In this section we will generalize this idea and discuss how we convert integrals in Cartesian coordinates into alternate coordinate systems. Included will be a derivation of the dV conversion formula when converting to Spherical coordinates.
