Throwing, for example, baseball pitching, is one of the most intensely studied athletic motions[1]. Although the focus has been more on the shoulder, the entire body movement is required to perform the act of throwing. Throwing is also considered one of the fastest human motions performed, and maximum humeral internal rotation velocity reaches about 7000 to 7500°/second[2].

From the clinical viewpoint, the statistical approach is still the cornerstone for exploring many diseases. This study was conducted to explore the risk factors related to acute kidney injury (AKI) for elderly patients using the multiple criteria decision-making (MCDM) approach. Ten nephrologists from a teaching hospital in Taipei took part in forming the AKI risk assessment model.
