CLR frees the developer from the burden of managing memory (allocating and freeing up when done); it handles memory management itself by detecting when memory can be safely freed. Instantiations of .NET types (objects) are allocated from the managed heap; a pool of memory managed by CLR. As long as a reference to an object exists, which may be either direct, or via a graph of objects, the ...

@KirkWoll: According to the language specification, the language itself must consider string to be exactly the same as the BCL type System.String, nothing else.That is not ambiguous at all. Of course, you can implement your own compiler, using the C# grammar, and use all of the tokens found like that for something arbitrary, unrelated to what is defined in the C# language specification.

(***) Under the hood the CLR has only two options: passing by value and passing by reference. The out modifier is the same as ref modifier plus the compiler checks for definite assignment. C# 7.2 introduces the third way of passing arguments: using in-modifier. The in-modifier is a way to pass the argument via readonly reference. Under the hood, the argument is passed by reference with a ...
