***Other developmental theories focus on growth that happens throughout the lifespan, such as Erikson's theory of psychosocial development. It would be natural to wonder which of the perspectives provides the most accurate account of human development, but clearly, each perspective is based on its own premises and focuses on different aspects of development. Many lifespan developmentalists use ...***

***Motor development. Motor development occurs in an orderly sequence as infants move from reflexive reactions (e.g., sucking and rooting) to more advanced motor functioning. This development proceeds in a cephalocaudal (from head-down) and proximodistal (from center-out) direction. For instance, babies first learn to hold their heads up, then sit ...***

***Developmental psychology is the scientific study of how and why human beings change over the course of their life. Originally concerned with infants and children, the field has expanded to include adolescence, adult development, aging, and the entire lifespan. Developmental psychologists aim to explain how thinking, feeling, and behaviors change throughout life.***

## [Child development - Wikipedia](#)

***Children who are not able to develop initiative resolve Erikson's third stage of development through guilt. Erikson describes the period of early childhood as a time of "vigorous unfolding," according to author Laura E. Berk. They begin to internalise concepts of right and wrong. Inability to Resolve Previous Stages of Development. Erikson's Theory of Psychosocial Development is foundational ...***

### [Milestones of Human Development](#)

***Failure to progress through a stage can result in fixation at that point in development, which Freud believed could have an influence on adult behavior. So what happens as children complete each stage? And what might result if a child does poorly during a particular point in development? Successfully completing each stage leads to the development of a healthy***

***Organisms of many species are specialized into male and female varieties, each known as a sex. Sexual reproduction involves the combining and mixing of genetic traits: specialized cells known as gametes combine to form offspring that inherit traits from each parent. The gametes produced by an organism define its sex: males produce small gametes (e.g. spermatozoa, or sperm, in animals) while ...***
